

Region Stockholm Transport Administration

Kristina Löwenberg
Robert Lagnebäck

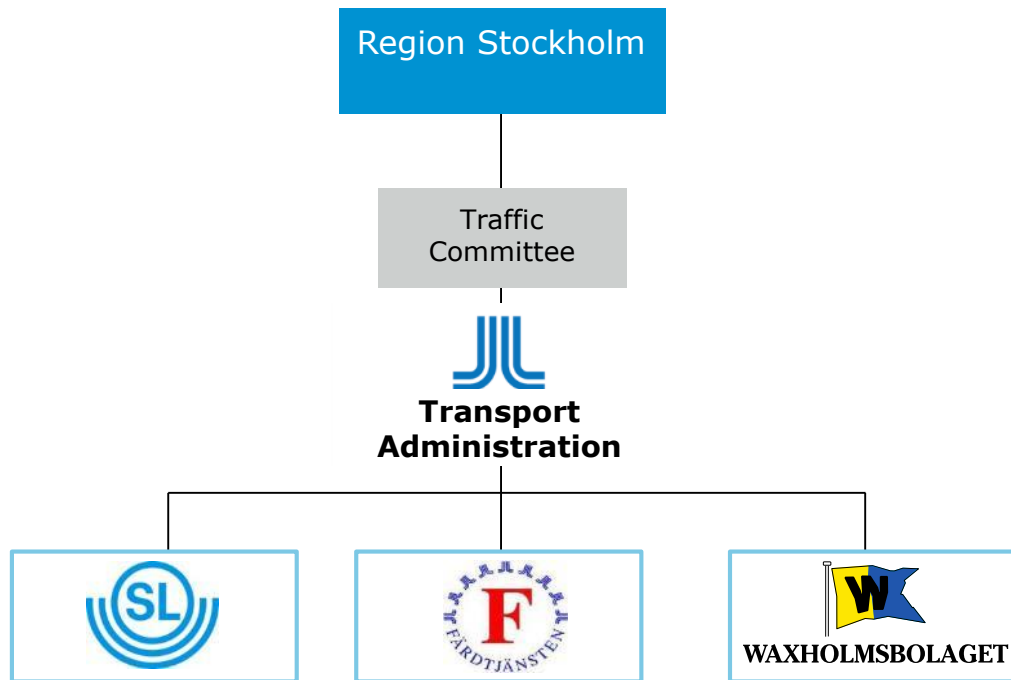

Vision

An attractive, sustainable and growing region in Stockholm with freedom for residents to shape their own lives and make vital decisions

Why? Our mission!

- We provide the region with public transport
- We take responsibility for the system
- We get more to choose public transport in stead of cars

Region Stockholm Traffic Committee

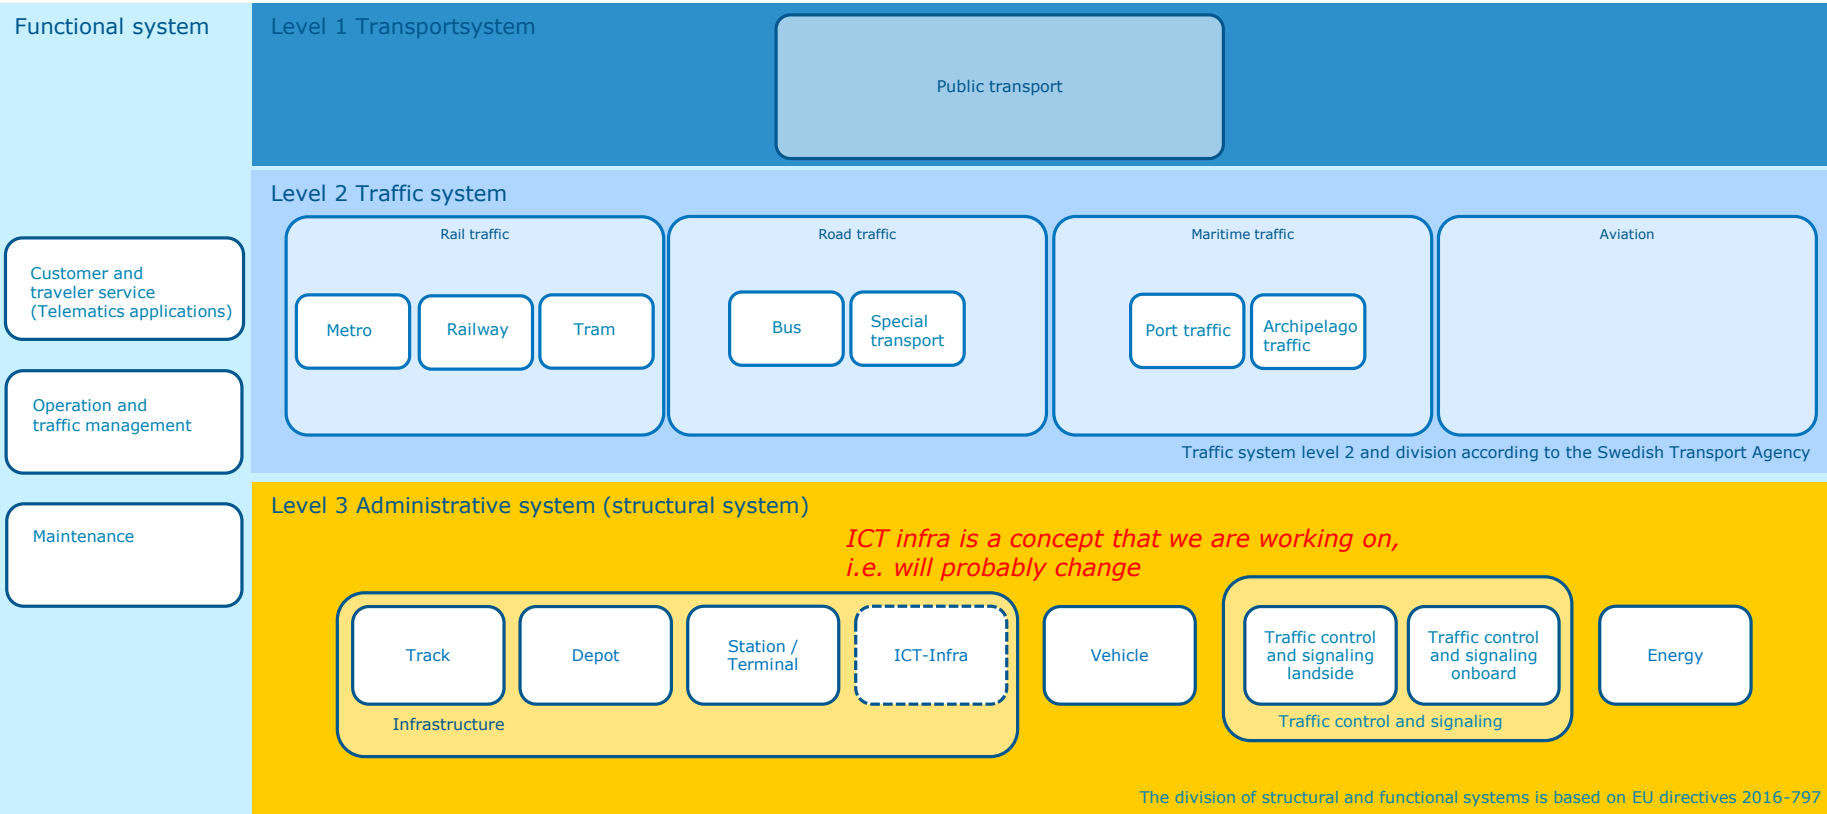

The Region appoints the members of the Traffic Committee.

The Traffic Administration is the administration organisation under the Traffic Committee.

The procured transportation services are presented through three brands

The services are financed by regional taxes and revenues from ticket sales.

The functional and structural systems of the public transport

Infrastructure

- 819 track vehicles
- 2211 buses
- 60 ferries
- 244 stations
- 167 bridges
- 233 km tracks
- 32 depots
- 900 000 m² properties (126 football fields)

Infrastructure and the value

Assets

- 819 track vehicles
- 2211 buses
- 60 ferries
- 244 stations
- 167 bridges
- 233 km tracks
- 32 depots
- 900 000 m2 properties

Replacement value

- 819 track vehicles
- 2211 buses
- 60 ferries
- 244 stations
- 167 bridges
- 233 km tracks
- 32 depots
- 900 000 m2 properties

Current value

- 819 track vehicles
- 2211 buses
- 60 ferries
- 244 stations
- 167 bridges
- 233 km tracks
- 32 depots
- 900 000 m2 properties

Short facts about our passengers

- 83% satisfied passengers (January 2020)
Commuter train 79%, metro 85%,
local trains 90%, bus 81%, boat 97%
- Passengers Waxholmsbolaget 4 million/year
- 900 000 passengers every day
- Special transport journeys 3 million/year
- SL.se 160 000 visitors every day
- SL-app 900 000 unique users every month

Our traffic

- Boardings 2,8 million/day
- 82 % market share in the morning peak in Stockholm
- Bus line 4 has as many passengers/day as SJ
- Every summer Waxholmsbolaget visits 270 jetties
- Revenue about 18 billions SEK/year
- Contracts traffic operators and maintenance 13,5 billions SEK/year
- All buses runs on renewable fuel since 2018

Strategic Challenges

- Global mean temperature
- Population growth
- Travel growth and share of public transport
- Increased expectations and needs
- Aging assets and overall costs
- Components and competence
- Revenues – it's all about money

Our daily challenges

Our challenge is to increase the capacity

- in the existing infrastructure...
- ...and integrate the Stockholm archipelago in public transport
- at the same time as we expand

All year round

Digitalisation and automation

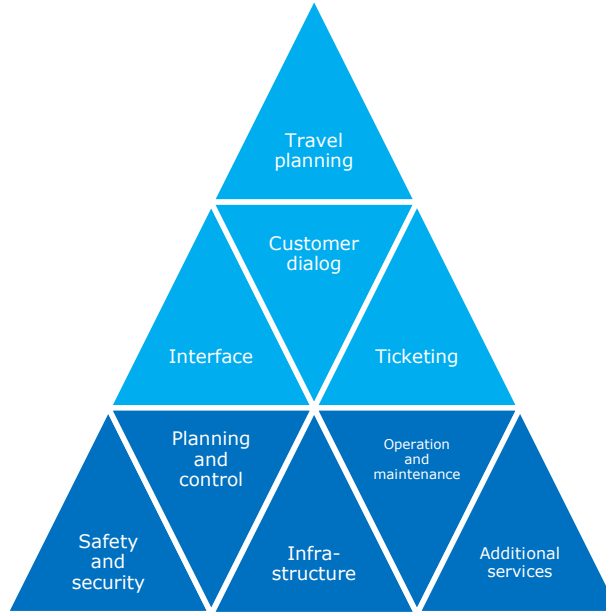

Opportunities and challenges Public Transport

Digitalisation and automation

Involves a symbiosis between technology, people and processes

- Opportunities and challenges for businesses and organizations to introduce new technologies and changed working methods in public transport

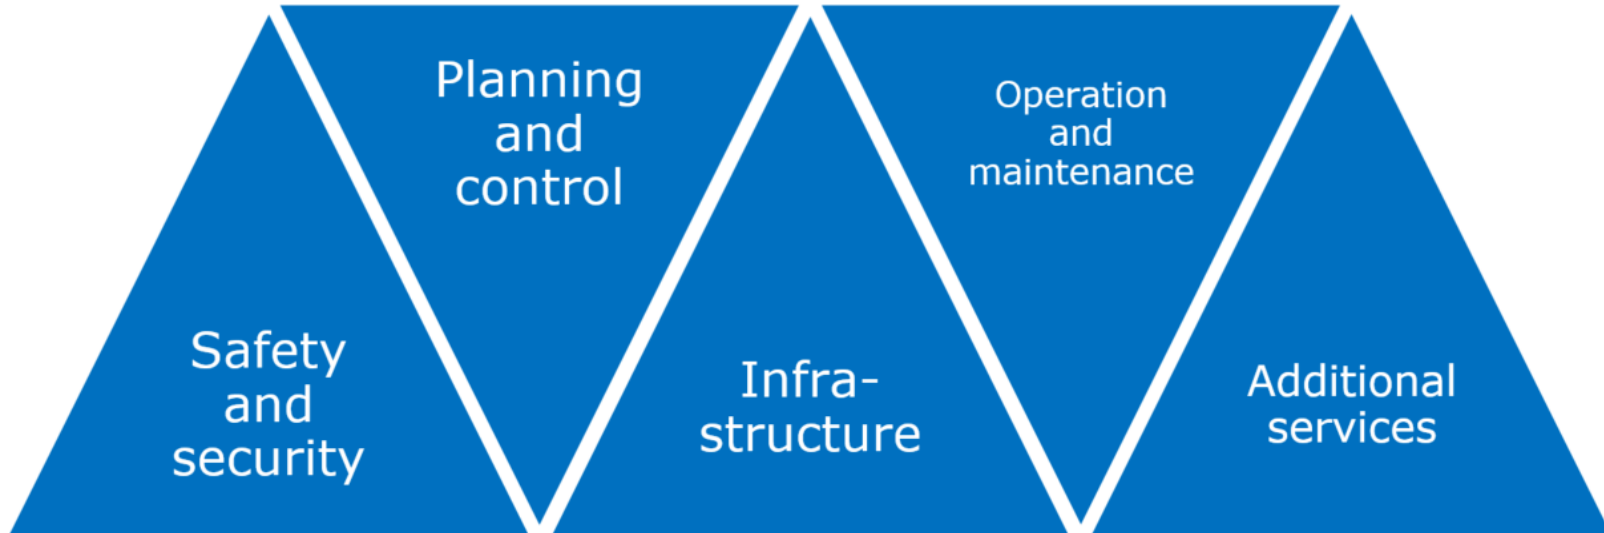

Public transport's digital solutions make life easier for everyone in the Stockholm region

Customer service

Operational support

Automation

The AutoHaul® autonomous railway system Australia has been announced as Western Australia’s top Engineering Excellence Award winner and Sir William Hudson Award finalist.

Described by Rio Tinto as the world’s largest robot, AutoHaul® is the first fully autonomous heavy haul railway system in the world. Trains up to 2.5 kilometres long can travel driverless across the world’s largest privately-owned rail network, which traverses some of nature’s most inhospitable landscapes.

The Australian Engineering Excellence Awards (AEEA) recognise Australia’s top engineering projects and the engineering teams behind them.

Following a rigorous judging process by an independent panel of experts, projects from each of Engineers Australia’s nine divisions are selected to win an AEEA. One winner from each division is also selected as a finalist for the Sir William Hudson Award – the highest honour for a project awarded by Engineers Australia.

Engineers Australia General Manager – WA, Susan Kreemer Pickford congratulated all WA winners on their teamwork, innovation, and technical excellence.

“The Australian Engineering Excellence Award winners showcase the outstanding achievement in engineering and the invaluable contribution engineering makes to the economy, community and the environment,” Ms Kreemer Pickford said.

Australian Engineering Excellence Award winners – WA

- AutoHaul® - Rio Tinto
- Groundwater Replenishment Scheme Stage 2 Expansion - Water Corporation of Western Australia
- Agnew Hybrid Renewable Project - EDL, Gold Fields
- Balticconnector Offshore Pipeline - Subsea Engineering Associates Pty Ltd
- Kalbarri Skywalk Structures, Kalbarri National Park - Terpos Engineering
- EZONE - University of Western Australia - Pritchard Francis Consulting Pty Ltd, The University of Western Australia

Maintenance focus

UITP four-step asset maintenance prediction

Data capturing

Quiet Track
POSS

QTMS, Quiet Track Monitoring System

- QTMS, Quiet Track Monitoring System, explore the possibilities with Internet of Things, Machine Learning and AI in order to increase track maintenance efficiency by giving a better understanding of the track conditions of the rail network. The effect is improved comfort with a higher availability and a more reliable service.
 - *Identification of abnormal levels of wear*
 - *Identification of potential rail track defects*
 - *Calibration of the maintenance requirements*
 - *Increased understanding of the interaction between vehicle and the track*
 - *Creates basis for cooperation between operation and infrastructure owner*
- The on train system is mounted on a train in ordinary traffic and consists of microphones and other equipment to measure and analyze the track conditions.
- The central system is being run as a cloud solution and consists of components for storage, graphical interface to show track parameters and to trigger alarms.
- The end user can use the graphic interface to understand and view the track conditions. An asset management system is able to communicate in real time with the central system through open API:s.

POSS Strukton

“POSS monitors the parameters that affect the performance of essential assets along railways, such as ***switches***, track circuits, level crossings and access detection. The parameters monitored by POSS, include temperature, current, impact, movement, humidity, hydraulic pressure and more.”

<https://strukton.com/en/rail/remote-condition-monitoring>

High level design of PoC

BEST-A

Asset information management system

- Asset inventory
- Work planning
- Work scheduling
- Follow-up

Based on Maximo platform (IBM)
with some additional interfaces to other systems

Map-function supported by 3D-scanning of the rail network

Process

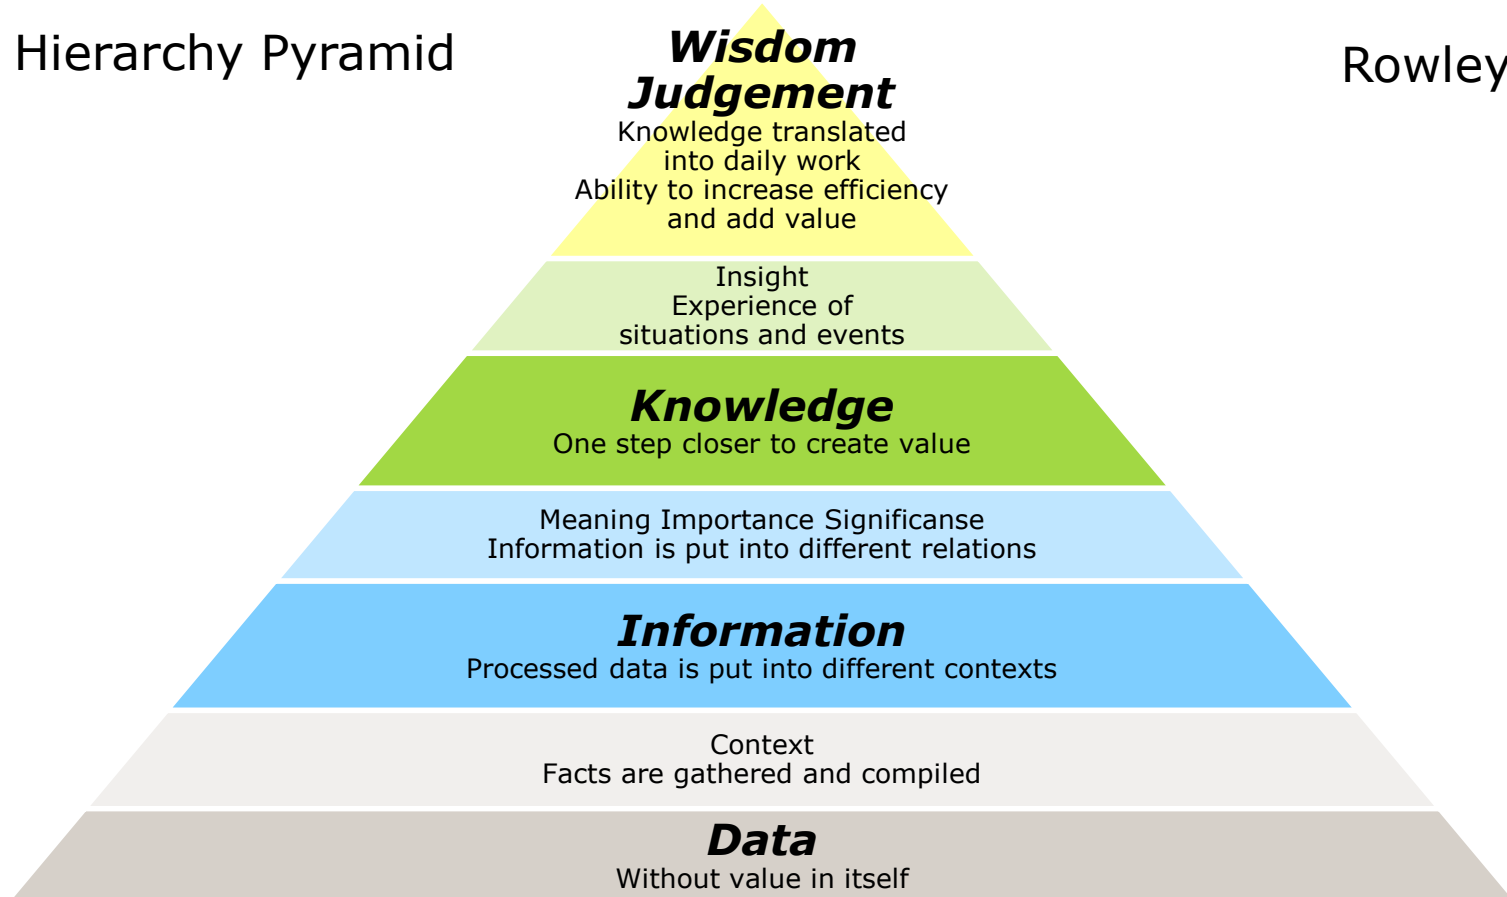

A good process is the key to development

Digitalisierung ist viel mehr, als bestehende Prozesse einfach nur digital abzubilden. Thorsten Dirks, ehem. CEO von Telefónica, brachte es mit dieser pointierten Aussage voll auf den Punkt.

DIKW Hierarchy Pyramid

Rowley 2007

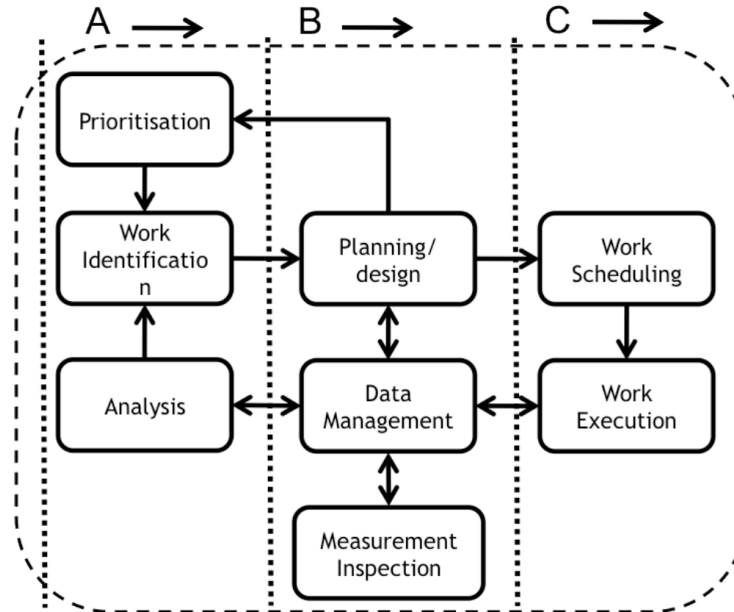

```
graph LR; GO[Goals Objectives] --> PR[Prioritisation]; PR --> WI[Work Identification]; PR --> PD[Planning/design]; WI --> PD; PD --> WS[Work Scheduling]; WS --> WE[Work Execution]; WE --> SP[System Performance]; PR --> GO; PD --> PR; WI --> WI; PD --> PD; WS --> WS; WE --> WE; SP --> SP; SP -.-> MI[Measurement Inspection]; MI -.-> GO; MI -.-> WI; MI -.-> PD; MI -.-> WS; MI -.-> WE; MI -.-> SP;
```

The flowchart illustrates the system engineering process. It begins with 'Goals Objectives' (a rounded rectangle) which points to 'Performance req.' (a chevron shape). 'Performance req.' points to 'Analysis' (a rounded rectangle). 'Analysis' points to 'Work Identification' (a rounded rectangle). 'Work Identification' points to 'Planning/design' (a rounded rectangle). 'Planning/design' points to 'Work Scheduling' (a rounded rectangle). 'Work Scheduling' points to 'Work Execution' (a rounded rectangle). 'Work Execution' points to 'System Performance' (a chevron shape). 'System Performance' points to 'Measurement Inspection' (a rounded rectangle). 'Measurement Inspection' points to 'Goals Objectives'. 'Measurement Inspection' also points to 'Analysis', 'Work Identification', 'Planning/design', 'Work Scheduling', and 'Work Execution'. A dashed box encloses the 'Goals Objectives', 'Prioritisation', 'Work Identification', 'Planning/design', 'Work Scheduling', 'Work Execution', and 'Measurement Inspection' components, indicating an iterative cycle.
